Title: Detection of Adrenal insufficiency (AI) in severe and moderate asthma

Method:

[Diagram showing the study design and analysis]

Results:

1. Patients were grouped according to level of adrenal function and attempted to see their clinical profile with the
2. No significant differences were found in clinical features or treatment response between the groups. However, AI patients tended to have milder disease severity, lower initial cortisol levels, and a higher prevalence of smoking.
3. In group B, the cortisol levels were significantly lower than in group C, with a trend towards lower levels in group A.
4. AI patients had a higher prevalence of smoking compared to the other groups.
5. There were no significant differences in the response to treatment between the groups.

Discussion:

AI patients had a higher prevalence of smoking compared to the other groups. Further studies are needed to determine the impact of smoking on adrenal function in asthma.

Summary and conclusion:

AI patients had a higher prevalence of smoking compared to the other groups. Further studies are needed to determine the impact of smoking on adrenal function in asthma.
